

LUNKER HUNTER SPOONPLUGGER MEETING 11/1/12

“3-WAY RIGS”

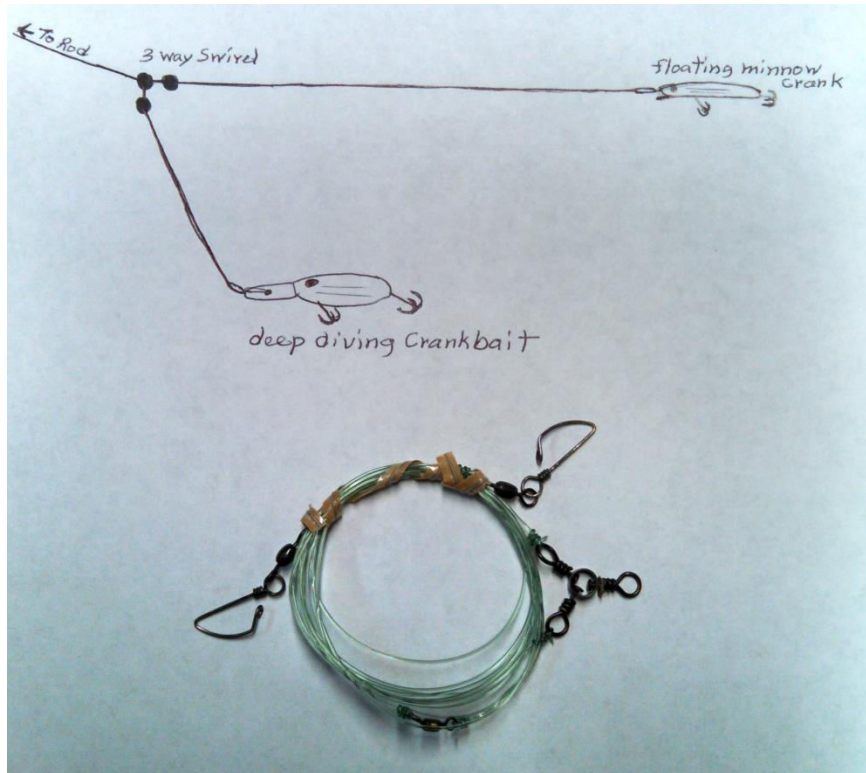

Diagram and rig secured with twistie

Tom Moore discussed and demonstrated the **many uses of 3-way rigs**. A 3-way swivel is used with a **2 to 1 ratio of long line to dropper**. If you fish alone, the **longest you should have is 3 feet** with an 18 inch dropper because the swivel won't go through the guides when you are **netting the fish**. **20 to 50 pound mono is used for the rig**, depending on the situation. Tom likes to use a **plastic grub or floating minnow crankbait on the longer line**. If a light **flutter spoon or a small Spoonplug is used** there, you will have to **keep moving forward** or it will fall and may foul. The **shorter dropper line** is where you use the **larger Spoonplug or deep-diving crankbait**. This is **used to pull both lures down to greater depths, up to 50 feet or more with wire line, without lead weights**. The **river rig** is a 3-way rig with **lead weight on the dropper** due to many **snags in most rivers**. These rigs can be **pre-tied, wound up, and stored with a “twistie”** to keep them contained. Thanks, Tom, for another informative program!
