

"WORKING TYPICAL STRUCTURE"

The **program subject** was "Working Typical Structure" from Buck Perrys' "Green Book", pages 135 to 138. We reviewed those pages and **discussed the ways to present lures checking all depths and all speeds on a typical structure, both casting and trolling.** It was noted that since **all structures are different,** the sequence and presentation may have to be altered to do the job. When Buck Perry classifies **all structures into 17 basic types,** it greatly **speeds up** the process of **knowing how to approach and present lures on a given structure** to fish it thoroughly.

The **video** was titled : "Buck Talks Markers" purchased from Bucks' Baits. It **shows Mr Perry making trolling passes to cover an inside bar in a reservoir. He first "mapped" by using his depth sounder to find the breakline, its shape, and the deepest water in the area.** By dropping a few **markers in key spots,** the **trolling passes can be made** to learn much more about the structure. **Straight line passes are essential in deep water**(more than 10 feet). No other fishing method obtains as much key detail information about the bottom lake structure as Spoonplugging. **Fish, like deer, make daily movements** and all they have to guide them is structure. **The more we know its' detail, the better we can pinpoint the fish.**

Next we **reviewed an article written by Scott Duff from Illinois titled: "Take Your Mapping All The Way Around"**. It was an experience he had in mapping and fishing a structure that reinforced the importance in **doing a thorough job mapping**. His original vision of the structure form was changed considerably after he did a more thorough job of mapping and presenting lures. **Too often we take a quick look at a structure and miss an important detail that could be key to finding fish on it.**
